Abstract

Korean *Panax ginseng* C A Meyer is mainly used to maintain the homeostasis of the body, and the pharmacological efficacy of Korean ginseng identified by modern science includes improved brain function, pain-relieving effects, preventive effects against tumors as well as anti-tumor activity, enhanced immune system function, anti-diabetic effects, enhanced liver function, adjusted blood pressure, anti-fatigue and anti-stress effects, improved climacteric disorder and sexual functions, as well as anti-oxidative and anti-aging effects. Further clinical studies of these pharmacological efficacies will continue to be carried out. Korean ginseng is found to have such main properties as ginsenoside, ployacetylene, acid polysaccharide, anti-oxidative aromatic compound, and insulin-like acid peptides. The number of ginsenoside types contained in Korean ginseng (38 ginsenosides) is substantially more than that of ginsenoside types contained in American ginseng (19 ginsenosides). Furthermore, Korean ginseng has been identified to contain more main non-saponin compounds, phenol compounds, acid polysaccharides and polyethylene compounds than American ginseng and Sanchi ginseng.

Introduction

Korean *Panax ginseng* C. A. Meyer, with thousands of years of history, has been traditionally known as a medicinal plant with mysterious powers in the Orient. Particularly in Korea, China and Japan, it has been known as the most valuable medicine of all medicinal herbs. Against this background, Oriental people have traditionally used ginseng roots and its extracts to revitalize the body and mind, increase physical strength, prevent aging and increase vigor. Many scientists, including Brekhman^[1] have introduced a new pharmacological concept to the meaning of the tonic effect of ginseng, resulting in interest and attention by explaining the basic pharmacology of ginseng with adaptogen effects. Brekhman^[2] asserted that ginseng increases non-specific resistance to various pathological factors that the body has, while helping to lower or to rise in order to return to normal physiological function by acting in a positive or negative way. Brekhman said that its effectiveness lasts long, and works better on an abnormal condition than a healthy one^[2-4].

Originally, the efficacy of Korean ginseng has been recognized based on Oriental medical science theory. On a gradual basis since the 1970s, modern scientific theory and technology have enabled scientists to determine theoretical properties of Korean ginseng. Nevertheless, scientific research and study on the pharmacological efficacy of Korean ginseng is only in its initial stages. In addition, world famous scholars have long poured their efforts into finding out which ingredient or substance of Korean ginseng gives rise to its mysterious efficacy, but research has made little progress and study results have fallen short of satisfactorily identifying the mystery of ginseng.

This review will discuss its characteristics as a medicinal plant, pharmacological efficacy and physiologically-active components of Korean ginseng that have been scientifically identified by modern science to date, and the result of comparative research on the efficacy and ingredients of ginsengs grown in a range of areas.

Korean ginseng denotes *Korean Panax ginseng* C A Meyer.

Characteristics of Korean ginseng as a medicinal plant

The botanical classifications of Korean ginseng are as follows:

Phylum: Embryophyta Siphonogama

Subphylum: Angiospermae

Class: Dicotyledoneae

Subclass: Archichlamydeae

Order: Umbelliflorae

Family: Araliaceae

Genus: *Panax*

The genus name *Panax* is a compound of the Greek words pan and axos. Pan means “all” and axos means “treat”, which represents “treats all diseases”. “Ginseng” indicates the name of the species of Korean ginseng and its Chinese pronunciation in English.

Ginseng is a perennial umbel plant, with one stalk having compound palmate leaves at its end. Its white fleshy root grows upright each year. Ginseng is originally a self-pollination plant. It starts to bloom at its third-year growth stage, and begins to blossom in the middle of May in Korea. In general, its seeds are obtained from a fourth-year growth plant, and flower buds are removed for seeds and root growth. Seeds are collected from the red berries, each having 2 pale yellow seeds in its fruit. At the time of picking, seeds do not have a clear embryo shape, and are immature, and need a dormant period and then ripen to enable germination. To remove the flesh from the harvested seeds, and to accelerate the growth of immature embryos, towards the latter half of July, ginseng growers put a mixture of seeds and sands into specially designed containers. They cultivate the seeds, including controlled watering for approximately 100 days (from the end of July to the beginning of November) in the shade, and then sow the seeds in seedbeds during the first half of November. Generally, plants that have been cultivated in seedbeds are transplanted at around the end of March or beginning of April.

Roots are pale yellowish white and are divided into a stout primary root, with 2 or 5 rootlets and root hairs. The size and shape of the rootlets depends on soil quality, water content, transplant methods, weather and fertilizer. Root age most strongly predicts root growth and shape. Ginseng roots are harvested between 4 and 6 years of age. Roots younger than these ages are referred to as being immature. Six-year-old ginseng roots are classified as being rhizomes (neck), primary roots and rootlets, resembling a human shape.

For a 6-year-old ginseng root, its rhizome (neck) grows thicker, and the primary root is about 7–10 cm in length

and 3 cm in diameter, having several stout rootlets. A root is usually about 34 cm long, and weighs 70–100 g with some roots weighing 300–500 g.

The new buds of ginseng are formed in its rhizome each spring and corms wither away and die in autumn. Traces are recorded in the rhizome each year and this affects the size and shape of the neck. The rhizome (neck) is an important factor that determines ginseng quality. Ginseng roots with a low number of scars on the rhizome are regarded as adulterated or poor quality products and tend to be sold at a cheap price. In this respect, it is recommended that special attention is paid to deal with ginseng in regard to quality. The neck area is a characteristic of Korean ginseng and a key identifier of the product to distinguish it from other ginseng products.

Pharmacological effects of Korean ginseng

Many researchers have tried to validate past empirical observations of the efficacy of Korean ginseng on the basis of modern physiological, biochemical and pharmacological knowledge. Recently, Korean ginseng has come to be highly recognized in Europe and the USA, based on studies of its efficacy and its tonic properties, which are frequently identified. A tonic medicine means that a drug that maintains normal physical tension or restores a morbid condition to a normal condition. *Panax ginseng* is known to have this efficacy, and many scientists agree that it acts to normalize the physical condition; that is to say, it maintains homeostasis^[1,2]. In addition, it is characterized by its fluent action, and no drug dependence or tolerance occurs despite a long intake period.

Scientifically proven pharmacological effects of Korean ginseng are as follows:

Efficacy of improving cerebral functions

Efficacy of increasing learning functions and reducing memory loss

1. Korean ginseng (extract and saponin component) is found to have efficacy to increase learning ability and improve memory to improve intellectual ability^[5].

2. Example of experiment: Korean ginseng shows efficacy to improve problems such as memory loss and decrease in exercise integration functions (tendency to easily slip during a rotating bar ride test) caused by alcohol administration^[6,7].

3. *Panax ginseng* ginsenoside- Rg₂ protects memory impairment via anti-apoptosis in a rat model^[8].

4. In Alzheimer's dementia, ginseng-treated patients showed clinical improvement at 4 weeks and showed continuing effects at 12 weeks. Ginseng treatment can im-

prove cognitive function in Alzheimer's dementia^[9].

5. Ginsenoside Rb₁ and Rg₁ showed memory-enhancing effects in more than 10 models including aged rats, cerebral ischemia-reperfusion, ovariectomized rats and β-amyloid induced memory impairment. G-Rg₁ improved all stages of memory (i.e. registration, consolidation and retrieval of memory)^[7].

6. Pharmacologically-active components: G-Rb₁, G-Rg₁, G-Rg₂

Improvement of intellectual work accomplishment efficiency

1. Results of clinical test in humans report that ginseng increases mental, intellectual work accomplishment efficiency (improvement of the power of attention, mental calculation)^[10].

2. Korean ginseng extract can modulate working memory performance and subjective ratings of "quality of life" and mood^[11].

3. Pharmacologically-active components: PT saponin, ginseng extract (40% ethanol extract).

4. Research results of anti-amnesia effects and improvement of brain ischemic disorder are expected to contribute further to research and development for the use of ginseng ingredients as a medicine to improve or to prevent recurrence of senile dementia or cerebral infarct where the main symptoms are memory loss or deteriorated cognitive functions, or to improve cerebral functions^[7,9-11].

Efficacy of relieving pain

1. In tests using sensory neurons, Korean ginseng was found to have an action inhibiting the Ca channel that exists on sensory neurons and is related to the pain transmission neuron.

2. Ginsenosides Rb₂, Rc, Rd, or Re injected supraspinally exert an antinociceptive effect in the substance P(Peptide)-induced pain model. Furthermore, Rb₁, Rb₂, Rd, or Rf given spinally produce antinociception in the substance P-induced pain model. In addition, ginsenosides Rb₁, Rg₂, or Rc given intrathecally induced antinociception in the proinflammatory cytokine-induced pain model^[12].

3. Pharmacologically-active components: G-Rf (component not contained in American ginsengs), Rb₁, Rb₂, Rc, Rd, Re, PT saponin.

Efficacy of preventing cancer and activate anti-tumor immunity

Efficacy of preventing cancers Results of epidemiological studies of Korean ginseng intake and cancer cases (4600 patients) show that those who take Korean ginseng are less likely to contract various cancers such as cancer of

the stomach, liver and lung than those who do not take it, and that increased intake leads to a lesser ratio of danger, proving its usefulness for primary prevention^[13,14].

Efficacy of inhibiting cancer cell growth^[15,16]

1. Saponin and non-saponin ingredients of ginseng contain activity inhibiting a variety of cancer cell growth^[17-27].

2. Ginsenoside Rp₁ suppressed the cell growth of 21 S and HeLa cells in a dose-dependent manner. It was suggested that ginsenoside Rp₁ can be used for anticancer action^[28].

3. An active substance (GFP) with stronger NO production in murine macrophages, that was isolated from red ginseng acidic polysaccharide, was found to increase the survival rate of male ICR mice transplanted with sarcoma 180, and showed more potent tumoricidal activities than natural killer cells^[29].

4. The post-operative intake of red ginseng extract has potential to improve earlier anti-cancer immunity with recovering interleukin-2 (IL-2) and reducing IL-10 from depressed IL-2 and elevated IL-10 by gastric cancer during postoperative chemotherapy^[30].

5. Pharmacologically-active components: G-Rg₃, G-Rh₂, G-Rp₁, polyacetylene compounds (panaxydol, panaxylinol, panaxytriol).

Efficacy of inhibiting the metastasis of cancer cells

1. Efficacy of inhibiting metastasis of cancer cells to the lung was observed in a test in which G-Rg₃ was given to a mouse to which tumor cells (colon cancer cells) were transplanted^[31].

2. Administration of G-Rb₂ to the skin of a mouse to which melanoma cells were transplanted inhibited tumor growth and the angiogenesis of tumor related to cancer cell metastasis^[32].

3. Pharmacologically-active components: G-R₃, G-Rb₂.

Efficacy of increasing anti-tumor activity of anti-cancer drug

1. Combination of Korean ginseng with mitomycin C increased the anti-cancer effect of Korean ginseng in comparison to the treatment of the anti-tumor drug (mitomycin C) alone^[17,33].

2. Pharmacologically-active components: G-Rh₂, panaxytriol.

Efficacy of inhibiting tolerance formation and reducing side effects of anti-tumor drugs

1. Efficacy of increasing cytotoxicity against tumor cells and reducing the side effects of anti-tumor drugs with the combination of Korean ginseng with anti-tumor drugs by inhibiting resistance formation that is a hindrance to anti-tumor chemotherapy^[34,35].

Professor WI HWANG at Korea University College of Medicine reported petroleum ethers as non-saponin anti-tumor activity components. The contents included Korean red ginseng 0.64%, Chinese red ginseng 0.47%, with the content of Korean red ginseng being about 30% higher than that of the Chinese counterpart. Comparison of Korean red ginseng with the Chinese one as ginseng components showed that overall inhibition activity of Korean red ginseng against the tumor cell growth of mouse leukemic cell (P388) which is the cancer cell line of leukemia, human colon cancer (HT-29) and rectal cancer cells (HRT-18) was significantly stronger than that of Chinese red ginseng^[19].

2. Pharmacologically-active components: 20(S)-Rg₃.

Efficacy of increasing immunization functions

1. Korean ginseng extracts have the ability to revive cellular immune response after it has been decreased by mitomycin. Ether extracts also have the effect of significantly reviving or increasing the activity of cellular immunity or natural killer (NK) cells^[17,30].

2. Pharmacologically-active components: G-Rh₂, extract.

Anti-diabetic efficacy

1. Ginseng saponin and ginsenoside Rh₂ has the efficacy of decreasing high blood glucose and improving diabetes by treating Streptozotocin (STZ), which is the substance that causes diabetes^[36-41].

2. Korean ginseng includes insulin secretion stimulating activity and insulin-like activity substances^[42-45].

3. Pharmacologically-active components: G-Rb₂, G-Rh₂, acidic peptide, adenosine, pyroglutamic acid.

Efficacy of improving liver functions

1. Korean ginseng has the activity of prompting the detoxification of toxic substances, protecting the liver from damage, and generating and promoting the regeneration and recovery of the liver^[46-50].

2. Alcohol detoxification capacity of Korean ginseng is effective for hangover treatment^[47].

3. Korean ginseng has anti-hepatitis activity^[51].

4. Pharmacologically-active components: G-Rb₁, G-Rg₁, G-Rf, G-Ro, ginseng extracts.

Efficacy of adjusting blood pressure

1. It is rumored that taking ginseng leads to high blood pressure. However, it lowers high blood pressure and heightens low blood pressure to return to normal. Recently, facts about the biochemical and pharmacological activities of ginseng related to blood pressure control are being gradually revealed by modern medical studies of effective ingredients and the efficacy of ginseng.

2. Korean ginseng improves blood circulation with its

vasodilation activity.

3. Korean red ginseng can exert an antihypertensive effect, which appears to be related to a lower rather than higher doses of ginsenosides^[52].

4. Blood pressure lowering activity of Korean ginseng saponin is made by VEC (vascular endothelial cell)-derived NO secretion promotion activity^[53,54].

5. Pharmacologically-active components: G-Ro, G-Rb₁, G-Re, G-Rg₁, G-Rg₃, PT components.

Efficacy of anti-fatigue and anti-stress

1. Korean ginseng shows a prolonged swimming time effect, and under forced exercise stress testing, improved exercise capability and prompted recovery from fatigue in a forced swimming experiment^[6,55].

2. It is observed that continued intake of Korean red ginseng is effective for prompted recovery from accumulated fatigue and prevention from sports anemia in athletes.

3. It is observed that Korean ginseng enforces the power to stand an unfavorable environment in a test of animals exposed to low temperatures (5 °C, 0 °C, -10 °C) and high temperatures (35 °C)^[56].

4. It is observed that Korean red ginseng has the effect to help to increase resistance to stress to maintain homeostasis by making exquisite adjustments against certain stressors and changes in the environment^[57].

5. Ginsenoside Rb₁ is the component, at least a major component, in ginseng with anti-stress activity. Rb₁ prevents the stress-induced impairments of reproductive function in male and female mice. Rb₁ also prevents the stress-induced brain degeneration in mice. Rb₁ may block stress response at a very early stage and consequently prevents adverse effects of stress^[58,59].

6. Panax ginseng extract has potential protective effects against the oxidative stress of PCBs (polychlorinated biphenyls)^[60].

7. Pharmacologically-active components: G-Rg₁, G-Rb₁, extract.

Efficacy of improving female climacteric disorder

1. A result of tests of women with climacteric disorders showed that overall, the administration (3 g/day, 2 months) of Korean red ginseng was effective for about 80% of them, adjusting the dose to increase treatment effect^[61].

2. Usage: Korean red ginseng 3.0–6.0g/day, more than 2 months.

Efficacy of improving male sexual dysfunctions

1. A test on animals suggested that Korean red ginseng defends males against sexual behavior disorders caused by stress^[55].

2. Korean red ginseng was evaluated as effective for the

improvement of sexual function. A clinical test indicated that the group who were given Korean red ginseng showed better effects in erectile function, sexual desire and satisfaction of patients than the control group^[62-66].

3. Daily treatment of male mice with purified ginsenoside Rg1 significantly increased the mounting frequency and the number of intromissions. However, ginsenoside Rb1 did not show a significantly enhancing effect on male mating behavior^[59].

4. Pharmacologically-active components: G-Rg1, Korean red ginseng extracts.

Efficacy of inhibiting AIDS virus (HIV) growth

1. AIDS is a chronic disease, and an examination of the anti-HIV activity of Korean red ginseng components revealed that HIV growth inhibition activity was observed in crude saponin components^[67-69].

2. The possibility that the occurrence of the deleted nef gene (gΔ nef) might be associated with long-term intake of Korean red ginseng^[70].

3. Pharmacologically-active components: crude saponin, Korean red ginseng extract and powder.

Efficacy of anti-oxidation and anti-aging activity

1. It is recognized that a free radical that is produced in excess of what is reasonably sufficient in the body greatly affects changes caused by diseases in the body such as inflammation, cancer, arterial sclerosis, brain diseases, and increase in lipid peroxidation, is the most important factor to aging.

2. Korean ginseng has the anti-oxidation effect of inhibiting the increase in harmful free radical formation and lipid peroxidation^[71-77].

3. A long-term administration of Korean red ginseng was found to be effective for prolonged life of tested animals^[78].

4. Pharmacologically-active substances: Phenolic compounds, polyacetylene compounds.

Physiologically-active components of Korean ginseng

Ginseng saponins The key active ingredients of ginseng are known to be a compound carbohydrate (a compound of alcohol or phenol and sugar) called saponin or ginsenosides. This property excites and suppresses the central nervous system, adjusts metabolism, lowers blood glucose, improves muscular activities, stimulates the endocrine system and maintains hormone levels properly.

The name saponin is derived from the phenomenon in which fine foam comes from its solution like a piece of soap. In general, glycosides form a very high polarization compound that causes hemolysis and fish poison. In addition, it combines with cholesterol in blood to form a complex body. What are the differences between ginseng saponin with little hemolysis and other saponins, if any? First, most ginseng saponins are a unique triterpenoid dammarane saponin that exists only in ginseng genus plant. Second, saponins found in other plants contain hemolysis, whereas ginseng saponin is a neutral glycoside that has little poison. Third, the pharmacological action of ginseng saponin is quite different to those of other medicinal plants. Finally, the molecular numbers of ginsenosides are as follows:

Ginsenoside-Rg1 (C₄₂H₇₂O₁₄ 2H₂O): 837

Ginsenoside-Rb1 (C₅₄H₉₂O₂₃ 3H₂O): 1163

Ginsenoside-Rf (C₄₂H₇₂O₁₄ 2H₂O): 837

Glycoside hydrolyzed by acid forms free sugars and aglycone. Panaxadiol, panaxatriol, and oleanolic acid are known as aglycones of ginseng glycoside. The glycosides of panaxadiol and panaxatriol are included only in ginseng. Their physiological activities draw much attention academically.

Modern analytical technology enabled us to determine the chemical structures of 66 ginsenosides (ginseng saponin). Thirty-eight ginsenosides were found in *Panax ginseng* C A Meyer (Korean ginseng), 19 ginsenosides in *Panax quinquefolius* L (American ginseng), and 29 ginsenosides in *Panax notoginseng* Burkill (Sanchi ginseng). Based on their chemical structures, saponin compounds are divided into three groups such as protopanaxadiol (PD)

Table 1. Content of ginsenosides of Korean white and red ginsengs.

Common (18)	Only in white ginseng (7)	Only in red ginseng (13)

Table 2. PPD, PPT and oleanane ginsenosides of Korean ginseng (white and red ginsengs).

Types	Ginsenosides	Total (38)
PPD type	ginsenosides-Ra ₁ , -Ra ₂ , -Ra ₃ , -Rb ₁ , -Rb ₂ , -Rb ₃ , -Rc, -Rd, -Rg ₃ , quinquenoside-R ₁ , malonyl-ginsenosides-Rb ₁ , -Rb ₂ , -Rc, -Rd, koryoginsenoside-R ₂ , ginsenosides-Rh ₂ , -Rs ₁ , -Rs ₂ , -Rs ₃ , 20(S)-ginsenoside-Rg ₃ , notoginsenoside-R ₄ , ginsenoside-Rg ₅	22
PPT type	ginsenosides-Re, -Rf, -Rg ₁ , -Rg ₂ , -Rg ₆ , -Rh ₁ , notoginsenoside-R ₁ , 20-gluco-ginsenoside-Rf, koryoginsenoside-R ₁ , ginsenoside Rf ₂ , 20(R)-ginsenoside-Rg ₂ , 20(R)-ginsenoside-Rh ₁ , ginsenoside Rh ₄ , 20(E)-ginsenoside F ₄	14
Oleanane type	ginsenoside Ro, polyacetyleneginsenoside-Ro	2

39, protopanaxatriol (PT) 25, and oleanane 2. The total number (38 ginsenosides) of Korean ginseng saponins is far more than those of American ginseng (19 ginsenosides) and *Panax notoginseng* (29 ginsenosides) (Tables 1–6)^[79,80]. As shown in Tables 1–6, ginsenosides Ra₁, Ra₂, Ra₃, malonyl-G-Rb₁, malonyl-G-Rb₂, malonyl-G-Rc, malonyl-G-Rd, Rs₁, Rs₂, Rs₃, Rg₃, Rg₅, Rh₂, K-R₂, Rf, Rf₂, 20(R)-G-Rg₂, Rg₆, 20(R)-G-Rh₁, 20(E)-G-F₄, Rh₄, K-R₁, and polyacetyleneginsenoside-Ro are only in Korean ginseng. To consider respective different pharmacological actions of each ginsenoside, it is clear that Korean ginseng has better pharmacological efficacy compared with other ginseng.

Korean researchers^[81] made an analysis of aglycone compounds in the primary root, rootlet and root hair. The ratio of panaxadiol and panaxatriol is about 1.0 per primary root, 1.5 per rootlet and 0.1 per root hair. The amount of saponin content in rootlets is twice as great as that of the primary, whereas the amount of saponin content in root hair is about the same as the primary root. Nevertheless, root hairs and rootlets are not used for medicinal purposes, which is thought to be a result of the saponin content. Han^[82] reported that when evaluating the medical effects of ginseng, it should be made using the correct ratio of panaxadiol and panaxatriol and absolute saponin content. This also applies to foreign ginsengs.

The high evaluation of Korean ginseng in the world market is not because of its mere appearance or manufacturing technology, but because of its medical effects. This may mean that the excellent efficacy of Korean ginseng bears relation to the ratio of panaxadiol and panaxatriol. The ratio of ginsenosides Rb₁ and Rg₁ contained in Korean ginseng is different from that of American ginseng or Notoginseng (Sanchi ginseng) (Table 7). The relative amount of Rg₁ contained in American ginseng is very small, whereas that of Rg₁ contained in Korean ginseng is

roughly the same.

Non-saponin physiologically-active components

Korean ginseng has important substances other than ginsenoside that show anti-tumor, anti-oxidative, anti-diabetic and anti-inflammatory effects, and even hematosiis action.

Dr SI KIM^[83] at Korea Ginseng and T Research Institute worked with Professor BJ AHN at Chungnam University College of Pharmacy to announce that the oil soluble ingredient contained in ginseng inhibited tumor growth in tested rats. These components are panaxydol, panaxynol and panaxytriol, and have displayed strong inhibitory effects on L1210 anti-tumor cells. Generally, polyacetylene compounds such as panaxydol, panaxynol and panaxytriol show anti-tumor and antioxidative effects^[83,84], and the content of polyacetylene compounds in Korean ginseng (0.89 mg/g dw) is even greater than those of American (0.64 mg/g dw) and Sanchi ginseng (Notoginseng) (0.75 mg/g dw).

Phenol compounds such as maltol show anti-aging effects as a lipid peroxidation inhibitor. Maltol is a phenol compound specific to Korean red ginseng. Carbohydrates are extracted in a water solution, and make up 60%–70% of total extracts. Monosaccharide, disaccharide, and trisaccharide and polysaccharide, and polysaccharide such as panaxans A-U display a hypoglycemic effect, increased immune system and anti-ulcerative activity. Particularly, acid polysaccharides such as panaxan Q-U have inhibition activities against active toxohormone-L^[44]. Korean ginseng has more acid polysaccharides than its American counterpart (Table 8).

Among refined oil properties, there is ispinene, which acts as a pain reliever and anti-inflammatory drug, and ocinene, which is an active element against abnormal intestinal fermentation. Particularly, the importance of non-saponin properties came to be recognized by the findings of anti-diabetic components such as adenosine, acidic peptide

G: Ginsenoside; Q: Quinquenoside; N: Notoginsenoside; Gy: Gypenoside; P: Pseudoginsenoside; *: yields from dried roots; **: side chain of D20 type; ***: modified side chain; ****: Koryoginsenosides.

Table 5. Oleanane saponin content of Korean ginseng, Sanchi ginseng and American ginseng (w/w %)*.

Oleanane type saponin	Korean ginseng (<i>P ginseng</i>)		Sanchi ginseng (<i>P noto-ginseng</i>)	American ginseng (<i>P quinque folius</i>)
	White	Red		
G-Ro	0.02	0.045	-	0.07
Polyacetylene-	?	-	-	-

*: yields from dried roots.

Table 6. Numbers of PPD, PPT and oleanane ginsenosides of Korean ginseng, Sanchi ginseng and American ginseng.

Type	Korean ginseng (<i>Panax ginseng</i>)	Sanchi ginseng (<i>Panax notoginseng</i>)	American ginseng (<i>Panax notoginseng</i>)
PPD type	22	14	13
PPT type	14	15	5
Oleanane type	2	-	1
Total	38	29	19

* Korean ginseng contains all of ginsenosides isolated from white and red ginsengs.

Table 7. The ratio of Rb₁/Rg₁ contained in Korean ginseng, American ginseng and Sanchi ginseng.

Research institute	Korean ginseng	American ginseng	Sanchi ginseng
Tanaka <i>et al</i> (1985)	1.33 (0.4/0.3)	8.00 (1.6/0.2)	0.91 (5.2/5.7)
Josep M Betz <i>et al</i> (1984)	0.89 (0.203/0.229)	4.77 (0.797/0.167)	-
Ko <i>et al</i> (1995)	1.23 (0.48/0.39)	10.3 (1.86/0.18)	0.94 (1.89/1.91)

Table 8. Acid polysaccharides content of Korean ginseng and American ginseng.

Description	Korean red ginseng	Korean white ginseng	American ginseng
Acid polysaccharide	74.65	6.27	3.22
%	7.47	0.63	0.32

and substance containing manganese, and non-saponin ingredients that have effective pharmacological activities. Before these reports, the importance of panaxydol and linoleic acid, inflammatory ingredients, have been emphasized. On top of those properties, Korean ginseng (*Panax ginseng* C A Meyer) contains properties having nitrogen such as protein and nucleic acid, essential amino acids and essential fatty acids. Notably, Korean ginseng still has more amino acids than American ginseng.
